# K-Means Clustering

COSC 410: Applied Machine Learning

Fall 2025

Prof. Forrest Davis

September 4, 2025

## Warm-up

- 1. Tell the person next to you about your favorite place to eat in town
- 2. How many groups do you think are in Figure 2?

## Logistics

- Lab 1 Due Friday
  - Submit one copy for a whole group and add your teammates as members to it
- Codelet o Due Friday September 5 at 11:59pm via Gradescop
- Codelet 1 released, please review it over the weekend

## **Learning Objectives**

- · Articulate the basic aims of k-means clustering
- Use Lloyd's algorithm to find clusters
- Distinguish different initialization strategies
- Articulate some core distinctions in training and evaluating models, especially around hyperparameter tuning

*Summary:* We layout the intuitions behind k-means clustering and give the standard algorithm used for fitting (Lloyd's Algorithm). We conclude with a discussion around initialization and broad approaches to hyperparameter tuning.

## K-Means Basic Aims

K-MEANS CLUSTERING IS ONE APPROACH TO MODELING our intuitions from the warm-up. At its core, k-means clustering seeks to

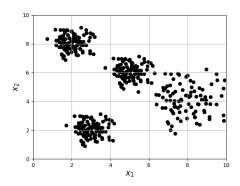

Figure 1: Sample data

find *k* clusters in a dataset. The basic approach uses Lloyd's Algorithm. More concretely, we are seeking *k* centroids which represent the point at the middle of the subset of the data belonging to a given cluster.

#### **Question**

Where would you expect the centroids for Figure 2?

The approach is straightforward, we first select k initial centroids by sampling randomly *k* samples from our data to serve as centroids. Then, while not **converged**:

- 1. Assignment: Assign each point to the centroid closet to it
- 2. Update: Calculate new centroids based on the mean of the labeled points

## Question

What do you think convergence means for k-means? How would you define closeness?

## K-Means Simple Example

WITH YOUR SMALL GROUP WORK THROUGH the k-means algorithm with the following initial centroids and dataset (visualized in Figure 2).

<sup>1</sup> The algorithm for k-means discussed here is also sometimes called Lloyd-Forgy method or simply the k-means algorithm due to its ubiquity.

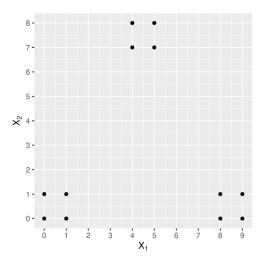

Figure 2: Sample data for group work

# **Practice Problems**

What are the final centroids and what cluster does each dataset belong to after apply k-means clustering with the initial centroids of:

$$C_1^{(0)} = (0,0)$$
 and  $C_2^{(0)} = (9,1)$ 

Point	$d(C_1)$	$d(C_2)$	Cluster	$d(C_1)$	$d(C_2)$	Cluster
(0,0)						
(0,1)						
(1,0)						
(1,1)						
(8,0)						
(8,1)						
(9,0)						
(9,1)						
(4,7)						
(5,7)						
(4,8)						
(5,8)						

Point	$d(C_1)$	$d(C_2)$	Cluster	$d(C_1)$	$d(C_2)$	Cluster
(0,0)						
(0,1)						
(1,0)						
(1,1)						
(8,0)						
(8,1)						
(9,0)						
(9,1)						
(4,7)						
(5,7)						
(4,8)						
(5,8)						

 $C_1^{(\ )}=(\ ,\ )$  and  $C_2^{(\ )}=(\ ,\ )$ 

 $\boldsymbol{C}_1^{(0)}$  is read as  $\boldsymbol{C}$  one – centroid one – at time step o.

## **Practice Problems**

What are the final centroids and what cluster does each dataset belong to after apply k-means clustering with the initial centroids of:

$$C_1^{(0)} = (0,1)$$
 and  $C_2^{(0)} = (1,0)$ 

Point	$d(C_1)$	$d(C_2)$	Cluster	$d(C_1)$	$d(C_2)$	Cluster
(0,0)						
(0,1)						
(1,0)						
(1,1)						
(8,0)						
(8,1)						
(9,0)						
(9,1)						
(4,7)						
(5,7)						
(4,8)						
(- 0)						
(5,8)						
Point	$d(C_1)$	d(C <sub>2</sub> )	Cluster	$d(C_1)$	d(C <sub>2</sub> )	Cluster
	$d(C_1)$	d(C <sub>2</sub> )	Cluster	$d(C_1)$	$d(C_2)$	Cluster
Point	<i>d</i> (C <sub>1</sub> )	d(C <sub>2</sub> )	Cluster	$d(C_1)$	$d(C_2)$	Cluster
Point (0,0)	<i>d</i> (C <sub>1</sub> )	$d(C_2)$	Cluster	$d(C_1)$	$d(C_2)$	Cluster
Point (0,0) (0,1)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0) (1,1)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0) (1,1) (8,0)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0) (1,1) (8,0) (8,1)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0) (1,1) (8,0) (8,1) (9,0)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0) (1,1) (8,0) (8,1) (9,0) (9,1)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster
Point (0,0) (0,1) (1,0) (1,1) (8,0) (8,1) (9,0) (9,1) (4,7)	<i>d</i> (C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster	d(C <sub>1</sub> )	<i>d</i> (C <sub>2</sub> )	Cluster

$$C_{1}^{\left(\;\right)}=\left(\;\text{, }\right)$$
 and  $C_{2}^{\left(\;\right)}=\left(\;\text{, }\right)$ 

#### K-Means++: Issues with Initialization

ABOVE, WE NOTED SOME ISSUES with a basic initialization strategy for k-means clustering. Let's dive into some deeper issues by considering the data plotted in Figure 3.2

<sup>2</sup> The example data here is adapted from this video

Figure 3: Dataset with four samples.

#### K-means++ Initialization:

- 1. Take one centroid  $c_1$ , chosen uniformly at random from the dataset.
- 2. Take a new centroid  $c_i$ , choosing a sample  $x_i$  with probability  $\frac{D(\mathbf{x}_i)^2}{\sum_{j=1}^m D(\mathbf{x}_j)^2}$ , where  $D(\mathbf{x}_i)$  is the distance between the sample  $\mathbf{x}_i$  and the closest centroid that was already chosen.
- 3. Repeat the previous step until all *k* centroids have been chosen.

#### Question

How does this new initialization effect model performance in Figure 3?

## A Bit Deeper into K-Means

LET'S DIG A BIT DEEPER INTO what k-means optimizes.3 In particular, we are seeking to optimize:

<sup>3</sup> The discussion here draws on Chapter 14 Section 3.6 from Hastie [2001].

$$\min_{C,\{m_k\}_1^K} \sum_{k=1}^K N_k \sum_{C(i)=k} ||x_i - m_k||^2$$
 (1)

#### Lloyd's Algorithm Redux:

- 1. For a given cluster assignment C the distances between points and a centroid is minimized when the centroids are the means  $\{m_1,\ldots,m_K\}$
- 2. Given a current set of means  $\{m_1, \ldots, m_K\}$ , the set of points which minimizes the distances in a cluster is obtained by labeling each point with the cluster mean closest to it That is,

$$C(i) = \arg\min_{1 \le k \le K} ||x_i - m_k||^2.$$

#### 3. Steps 1 and 2 are iterated

These facts guarantee that our algorithm will converge! However we may land at a local minimum that isn't the best globally.4

## General Considerations for Hyperparameter Tuning

There are no parameters in this model. The k we choose is a hyperparameter, it is not updated during training (i.e., it is not learned). There exist a number of techniques for hyperparameter tuning, some of which we will cover in a lab. We will take some time here, in the slides, to set up some basic terms that will be helpful later.

#### **Before Next Class**

• Read Chapter 6 of Hands on Machine Learning (linked on the course website) and complete the pre-class quiz
